

The art of design

PATENTED

We would like to present to you the all new Smart Connector system collection which is a world premiere, developed and manufactured according to the instructions of our team engineers and designed to solve the current problems of installation on site and replacement of lighting elements with LED strips.

The collection is made up of 4 different profile designs and 3 connector models. It will soon be complemented by 2 new spotlight designs that will include the Smart Connector system and also with two new joining connectors for profiles, one for straight unions and the other for 90° unions (with this two new connector you can use the remaining short profile sections that you normally discard) this four last product are currently being developed.

The greatest contribution of the Smart Connector system collection to the market is the ease of making profiles to the desired size without the need for welding and therefore saving installation time, you don't need to assemble them in your work shop, you can just can do it directly on site with a circular saw to cut the strips and manually plug in and that's it.

Its main features are:

1) The profiles are supplied with a Led strip glued inside and its plastic diffuser. The Titanium finish color used in all the profiles gives them the subtle elegance that distinguishes them from the other profiles availables in the market.

2) The set can be cut to the desired size , with the same saw that the wood is cut.

3) The Led strip is designed to be able to be cut at any point, avoiding the classic faults in lightings as in conventional Led strips that are cut every 3 Led points, thus saving a lot of LED strip.

4) The Led strip contains continuous connection poles to be able to install the connector in any position after cutting.

5) The Led strip contains 150 points per meter, to achieve the neon effect in all designed profiles. With 12v and 8w/mt we achieve medium to high lighting, perfect for lighting a wide scope of furniture and decoration in general, saving on trans form materials. Available in warm and neutral light.

6) The connector is installed by hand by pushing it into the profile with light pressure thus facilitating assembly and replacement.

7) We developed connectors with different functions, with and without plastic caps, thus to be able to connect to both sides of the profile and Led strip, to make joints and also with a touch sensor and always attached to a 2mt cable with plugin terminal.

8) Models L216 Vision and L217 Tech are available with reversible polarity cables for right or left hand installation

Model L215 Elite, is a surface profile, medium luminosity and minimalist design and were the LED dots are not visible.

It has the Smart Connector system for easy connection and replacement. Available in bars of 2,35mt cuttable to any size in titanium color. Recomended for lighting furniture and showcases.
